Notes

- Cutting data provided should be considered advisory only. Adjustments may be necessary depending on the application, workpiece rigidity, machine tool, etc.

- The XV7 / XV7CB should only be used in accurate tool holders with high gripping power. ER collet type holders are not recommended.

Helical interpolation recommendations:

- Under optimal conditions, with proper coolant flow/air blast techniques, up to 3° helical ramp angles are achievable with the XV7 / XV7CB in most materials
- A reduction of 30-50% in both cutting speed (Vc) & feed per tooth (fz) are recommended
- Recommended hole diameter = $1.9 \times D$

XV7 / XV7CB Series Recommended Cutting Data - Chip Thickness Compensation Factors - Inch

| RWOC (ae) | Chip Thicknesss Compensation Factor |
|--------------|--|
| 2% | 3.57 |
| 3% | 2.93 |
| 5% | 2.30 |
| 7% | 1.96 |
| 8% | 1.84 |
| 10% | 1.67 |
| 13% | 1.49 |
| 15% | 1.40 |

During profile milling with a radial width of less than 50% of the cutter diameter, the actual chip thickness at the cutting edge is less than the programmed chipload. The accompanying table shows the increase in chipload by given radial width percentage to adjust for chip thinning. Multiply your recommended chip thickness by the appropriate feed factor to establish the correct feed rate.
